3.1.7 Activity: Word Frequency Counter

LEARN IT

Count how many times each word appears in a sentence. This is a classic use of a **dictionary** plus `.get()`: the word is the key, the count is the value.

```
sentence = "python is easy python is fun python is powerful"
words = sentence.split()
word_freq = {}
for word in words:
    word_freq[word] = word_freq.get(word, 0) + 1
print(f"Sentence: '{sentence}'\n")
print("Word Frequency Table:")
for word, count in word_freq.items():
    print(f"{word:<10} : {count}")
top_word = max(word_freq, key=word_freq.get)
print(f"\nMost Frequent: '{top_word}' ({word_freq[top_word]} times)")
```

WORKED EXAMPLE

Logic, step by step.

1. `sentence.split()` cuts on spaces and gives
['python', 'is', 'easy', 'python', 'is', 'fun', 'python', 'is', 'powerful'].
2. For a new word, `word_freq.get(word, 0)` is 0, then you store $0 + 1 = 1$.
3. For a word already in the dictionary, `.get(word, 0)` returns the current count, then you add 1.
4. `{word:<10}` pads the word to 10 characters so the colons line up.
5. `max(word_freq, key=word_freq.get)` picks the key whose value is largest. If two words share the top count, `max` returns the first of those keys in insertion order.

OUTPUT

Sentence: 'python is easy python is fun python is powerful'

Word Frequency Table:

```
python      : 3
is          : 3
easy        : 1
fun         : 1
powerful    : 1
```

Most Frequent: 'python' (3 times)

After seeing	word_freq
python	{'python': 1}
is	{'python': 1, 'is': 1}
easy	{'python': 1, 'is': 1, 'easy': 1}
python (again)	{'python': 2, 'is': 1, 'easy': 1}
... end of sentence	{'python': 3, 'is': 3, 'easy': 1, 'fun': 1, 'powerful': 1}

Here `python` and `is` both occur 3 times. `max` returns '`python`' because it appears first in the dictionary.

REMEMBER IT

The heart of every counter is one line: `d[item] = d.get(item, 0) + 1`. You can count letters, roll numbers or votes with the same pattern.

COMMON MISTAKE

This program is case-sensitive and space-based. "`Python`" and "`python`" would be two keys. Punctuation such as `easy.` would not match `easy`. For a class exercise, keep the sentence lowercase with spaces only, as here. If you wrote `word_freq[word] += 1` without `.get` on a new word, you would get `KeyError`.

اردو میں سمجھیں

جملے کو `.split()` سے الفاظ کی فہرست بناتے ہیں، پھر ہر لفظ ڈکشنری میں کلید ہوتا ہے اور اس کی گنتی قدر۔ نئے لفظ کے لیے `1 + get(word, 0)` سے گنتی 1 سے شروع ہوتی ہے۔ `max(..., key=word_freq.get)` سب سے زیادہ بار آنے والا لفظ دیتا ہے۔

CHECK YOURSELF

1. How many times does "is" occur in the sample sentence?
2. Why use `.get(word, 0)` instead of `word_freq[word]` on the right-hand side?

Answers: 1. Three times. 2. Because a brand-new word is not yet a key; `.get` returns 0 instead of raising `KeyError`.
