2.5 Concept of Data Structure ★ Golden

LEARN IT

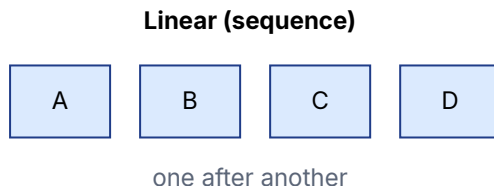

A **data structure** is a systematic way of **organising, storing and managing** data so that an algorithm can access, modify and process it efficiently.

Real-life analogy. Books on a shelf are arranged in a set order, so you can find a title quickly. Files in folders are grouped on purpose. Data structures do the same job inside computer memory.

1. Linear data structures

Elements stand in a strict sequence, one after another. Each element (except the first and last) has exactly **one predecessor** and **one successor**.

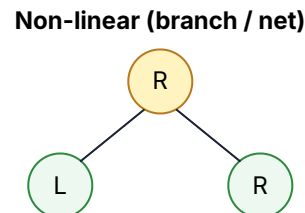

Examples: Array, Linked List, Stack, Queue.

2. Non-linear data structures

Elements are connected in a hierarchy or a network. One element can connect to **several** others at the same time.

Examples: Tree, Graph.

Linear: a line of neighbours. Non-linear: a node with more than one connection.

WORKED EXAMPLE

Worked example: classify each everyday picture.

1. Students standing in a single assembly line → **linear** (each has one in front and one behind).
2. A family tree of grandparents, parents and children → **non-linear** (one parent, several children).
3. Roads linking Karachi, Hyderabad, Sukkur and Larkana in many ways → **non-linear** (a network).

REMEMBER IT

Ask: "Does each item have at most one next item?" Yes → linear. "Can one item link to many, or can links form a net?" → non-linear.

COMMON MISTAKE

Mistake: calling a tree "linear" because you can walk it from top to bottom.

Fix: walking is traversal. The **shape** is hierarchical: one parent, many children. That is non-linear.

ڈیٹا سٹرکچر ڈیٹا کو منظم طریقے سے رکھنے کا نظام ہے تاکہ الگورتھم اسے جلدی استعمال کر سکے۔ لکیری ڈھانچوں میں عناصر قطار میں ہوتے ہیں (ایرے، لنکڈ لسٹ، سٹیک، کیو)۔ غیر لکیری میں ایک عنصر کئی سے جڑ سکتا ہے (ٹری، گراف)۔ الماری کی کتابیں اور فولڈرز کی مثال یاد رکھیں۔

EXAM TIP

Define data structure in full (organise, store, manage; efficient access and processing). Then split linear vs non-linear with the "one predecessor and one successor" test, and list the four linear and two non-linear examples. The shelf / folder analogy earns a mark. MCQs: "Which is non-linear?" → Tree or Graph.

CHECK YOURSELF

1. Define data structure.
2. Name four linear and two non-linear examples.
3. What is true of each middle element in a linear structure?

Answers: 1. A systematic way of organising, storing and managing data for efficient access, modification and processing. 2. Linear: array, linked list, stack, queue. Non-linear: tree, graph. 3. It has exactly one predecessor and one successor.
