6.5 Types of Prototypes

LEARN IT

Prototypes are commonly divided into **three types** according to their level of detail, called **fidelity**.

Fidelity means how close the prototype is to the final product. Low fidelity = far from final; high fidelity = very close to final.

6.5.1 Low-Fidelity Prototype

A **quick and rough** model made at the **very beginning**. It is **drawn on paper**. It does **not focus on colours or fonts**. It shows the **main idea and flow** (which screen comes after which). It is **very suitable for students** because it is **cheap, fast, and easy to change**.

6.5.2 Mid-Fidelity Prototype

Clearer than a paper sketch. It is created in **PowerPoint, Canva, or Figma**. It shows screens and **navigation** in a more organised way, but **without final graphics**. It is useful to **test screen-to-screen navigation**, for example by linking slides so that clicking "Next" opens the next screen.

6.5.3 High-Fidelity Prototype

Looks **very close to the final product**. It includes **realistic colours, buttons, sample data, and working features**. It **takes more time** and should **only be created after the basic idea is tested**.

Comparison of prototype types

For most school and college projects, you should **begin with a low-fidelity prototype**. A common mistake is to start building a full app before knowing whether users need it. A rough prototype protects you from this mistake.

Table 6.3: Types of prototypes

Type	Meaning	Best Use	Example
Low-Fidelity	A quick and rough model of the idea.	Very early testing.	Hand-drawn app screens for homework reminder.
Mid-Fidelity	A clearer model that shows layout and flow.	Testing navigation.	Clickable screens in PowerPoint or Figma.
High-Fidelity	A detailed model close to the final product.	Testing realistic experience.	Working demo of a small order form website.

Low-Fi (Paper)

Mid-Fi (PowerPoint)

High-Fi (Figma/HTML)

Extra comparison to help you revise:

Feature	Low-Fidelity	Mid-Fidelity	High-Fidelity
Tool	Paper and pencil	PowerPoint, Canva, Figma	Figma (detailed), HTML
Colours and fonts	No	Not final	Realistic
Clickable?	No (you move papers by hand)	Yes, basic links	Yes, with working features
Cost and time	Lowest, fastest	Medium	Highest, slowest
Easy to change?	Very easy	Fairly easy	Harder
When	Very beginning	After the flow is agreed	Only after the basic idea is tested

WORKED EXAMPLE

Worked example: one idea, three fidelities. Idea: a Homework Reminder for a college in Jacobabad.

1. **Low-fi:** Sana draws three screens on paper in 15 minutes: "Today", "Add homework", "Reminder". Classmates point at the drawings to "use" them.
2. **Mid-fi:** After feedback, she makes three PowerPoint slides with grey boxes and links them with hyperlinks, so tapping "Add" opens the Add slide. Now she tests whether people can move between screens easily.
3. **High-fi:** Once users clearly want it, she builds a small HTML page with real colours, a working form and sample homework data.

Each step costs more, so she only moves up when the previous step proves the idea is worth it.

REMEMBER IT

Fidelity = "faithfulness" to the final product. Remember **Paper → PowerPoint → Polished** (low → mid → high).

COMMON MISTAKE

Mistake: Starting with a high-fidelity prototype or a full app because it "looks professional".

Fix: Begin with low fidelity. If users do not need the idea, you have lost only paper and an hour, not weeks of work.

اردو میں سمجھیں

فِڈیلیٹی (Fidelity) کا مطلب ہے کہ پروٹوٹائپ حتمی پراڈکٹ سے کتنا ملتا جلتا ہے۔ لو فِڈیلیٹی کاغذ پر بنایا گیا سستا اور جلدی بننے والا خاکہ ہے؛ مڈ فِڈیلیٹی پاورپوائنٹ، کینوا یا فگما میں بنتا ہے اور اسکرینوں کے درمیان آنا جانا (Navigation) دکھاتا ہے؛ ہائی فِڈیلیٹی بالکل اصل پراڈکٹ جیسا لگتا ہے اور اسے بنیادی خیال آزمانے کے بعد ہی بنانا چاہیے۔

CHECK YOURSELF

1. What does "fidelity" mean?
2. Which type of prototype is best for testing navigation?
3. Why should students begin with low fidelity?

Answers: 1. How close the prototype is to the final product. 2. Mid-fidelity (e.g. clickable screens in PowerPoint or Figma). 3. It is cheap, fast and easy to change, and it protects them from building a full app before knowing whether users need it.
