6.13 Testing an MVP

LEARN IT

MVP testing means giving the basic working version to **real users** and **studying their response**. The team should collect **both numbers and comments**.

- **Numbers** (quantitative data) show how many users tried the MVP and how many may use it again.
- **Comments** (qualitative data) explain what users liked, disliked, or found confusing.

Testing should be **planned before the MVP is launched**. Decide:

1. **How many users** will test it.
2. **How long** the test will continue.
3. **What information** will be collected.

Table 6.10: Feedback during MVP testing

Type of Feedback	Question	Example Result
Number-based	How many users tried it?	40 students used the form.
Number-based	How many would use it again?	30 out of 40 said yes.
Comment-based	What was confusing?	Did not know order closing time.
Observation	Where did users face difficulty?	Forgot to enter class name.

Observation means the team watches users and notes difficulties themselves, even ones users do not mention.

WORKED EXAMPLE

Worked example: studying the results in Table 6.10.

1. **Repeat-use rate** = (users who would use it again ÷ users who tried it) × 100 = (30 ÷ 40) × 100 = **75%**.
2. **Did not want to use again** = 40 – 30 = **10 students** = (10 ÷ 40) × 100 = **25%**.
3. **Comment:** "Did not know order closing time" → **Fix:** write "Orders close 20 minutes before break" at the top of the form and in the WhatsApp message.
4. **Observation:** "Forgot to enter class name" → **Fix:** make the Class field **required** in the Google Form so it cannot be submitted empty.
5. **Decide what to fix first:** the closing-time problem stops people from ordering at all, so fix it first; the class-name problem only makes collection slower.

Three out of four users would come back, which is a promising sign; fixing the two problems could raise that number further.

REMEMBER IT

Data skill link. Feedback is useful only when it is studied: **Count** the responses → **Look** for repeated problems → **Decide** which improvement comes first. Remember "**C-L-D**: Count, Look, Decide."

COMMON MISTAKE

Mistake: Launching the MVP first and deciding later what to measure.

Fix: Plan the number of users, the test length and the questions **before** launch. Otherwise you may forget to record important data (for example, how many people opened the form but did not submit).

اردو میں سمجھیں

ایم وی پی کی جانچ کا مطلب ہے کہ بنیادی کام کرنے والا ورژن اصل صارفین کو دیا جائے اور ان کے ردعمل کا مطالعہ کیا جائے۔ اعداد بتاتے ہیں کتنے لوگوں نے استعمال کیا اور کتنے دوبارہ کریں گے، جبکہ تبصرے بتاتے ہیں کیا پسند آیا اور کیا الجھن تھی۔ جانچ کی منصوبہ بندی پہلے سے کریں، جوابات گنیں، بار بار آنے والے مسائل تلاش کریں اور پہلے سب سے اہم بہتری کریں۔

CHECK YOURSELF

1. Name the three types of feedback in Table 6.10.
2. If 50 people tried an MVP and 35 would use it again, what is the repeat-use rate?
3. Name the three things to decide before launching an MVP test.

Answers: 1. Number-based, comment-based, observation. 2. (35 ÷ 50) × 100 = 70%. 3. How many users will test it, how long the test will continue, and what information will be collected.
